

SHIFTING YOUR TRAP

ONLY IF
NEEDED

CONSTANT CONTROL

Goodnature develops products for the constant control of invasive pests. This is achieved by establishing a permanent network of traps to knock down target populations and then be ready for the inevitable reinvasion.

Rather than shift your traps, it is better to add to the trapping network and increase your pest free area. If however, you need to move your trap or have found a better location for it, then it is very important that you follow the instructions below.

HOW TO DO IT SAFELY

To shift the trap, unscrew the current CO₂ CANISTER from the trap. You may experience the noise of any remaining gas in the canister escaping, which may cause the canister to chill.

WARNING:

Although the CO₂ CANISTER has been removed the trap may still be live with one charge remaining in its chamber. To de-pressurise the trap, firstly remove the SHROUD CAP, unscrew the LURE BOTTLE, and fire the remaining charge in the trap by reaching a stick down through the LURE BOTTLE CRADLE and pushing the LEAF TRIGGER (i.e. the steel wand) sideways. The striker will discharge with a bang. Always treat the trap as live until you have de-gassed and de-pressurised it. Always keep fingers clear of the SHROUD ENTRANCE.

If the trap doesn't fire then it has run out of gas at some earlier point.

With the trap de-pressurised place your palm beneath the trap's entrance. Using your thumb and forefinger, squeeze the BLACK TABS of the TRAP BODY inward beneath the orange TREE MOUNT. With upward pressure ease the TRAP BODY up and off the orange TREE MOUNT.

Use Goodnature's RODENT DETECTOR CARDS to determine the best place to move your trap to. See the section named 'ASSESS - DON'T GUESS' on Page 5.

IMPORTANT:

You must de-gas and de-pressurise your trap before moving it.

DE-GAS

DE-PRESSURISE

DETACH
